

POC Idea: Chat-based Internal Knowledge Assistant (Langflow)

Overview:

A chat-based assistant built using Langflow to help internal teams (QA, Development, Product) quickly access information from systems like Jira and Confluence. The assistant will act as a single interface to answer queries related to requirements, defects, and releases.

Objective:

To improve team productivity by enabling faster access to project-related information and reducing dependency on manual communication.

Approach:

- Implement a tool-based agent using Langflow (without RAG for initial POC)
- Integrate with Jira and Confluence APIs
- Allow the system to interpret user queries and fetch relevant data dynamically
- Provide summarized, context-aware responses

Sample Use Cases:

- Retrieve open defects and their status
- Generate release summaries from Jira tickets
- Fetch requirement details from documentation
- Identify known issues in specific modules

Expected Outcome:

- Faster information retrieval
- Reduced back-and-forth communication within teams
- Foundation for scaling into a more advanced AI assistant
